

Clinical Healthcare Solutions

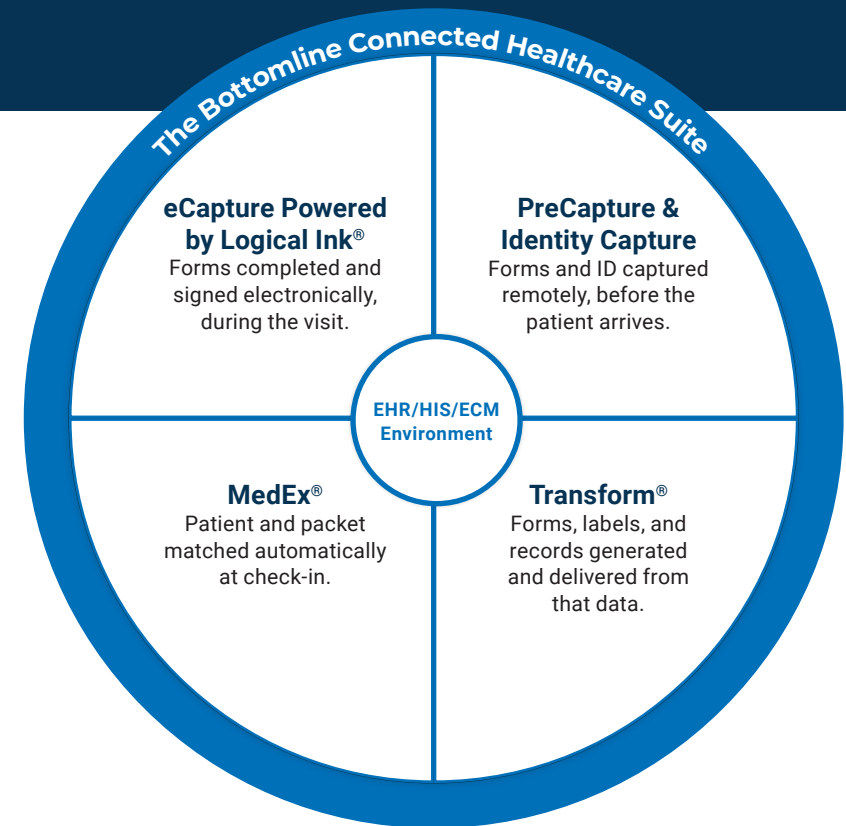

Connect forms-driven patient workflows with the electronic health record (EHR), health information system (HIS), and enterprise content management (ECM) systems you already rely on.

Hospitals and health systems don't need another digital form solution—they want the workflows they already have to work better. And when they don't, the impacts are clear: staff have to rekey the same information across forms and systems, chase missing signatures, and fall back to paper when primary systems go down.

Bottomline's clinical healthcare solutions connect forms-driven patient workflows with most major EHR, HIS, and ECM systems using Health Level Seven (HL7) standards, helping health organizations capture, generate, and route information before, during, and after patient visits—without replacing the systems an organization already relies on.

Strengthen the Workflows Around Your HIS

- Eliminate rekeying and chasing paperwork—capture accurate information once, electronically, the first time.
- Speed up registration with prefilled, verified patient information at every check-in.
- Support patients before they arrive, with self-service forms and identity verification.
- Keep registration and document production running when the primary EHR is unavailable.
- Produce and deliver forms, labels, wristbands, and documents in the format each workflow needs.
- Give authorized users single sign-on (SSO) access and patient-level audit logs for security and compliance review.

HL7-ready

Integrates with major EHR, HIS, and ECM environments.

SSO + audit logs

Secure access with patient-level and form-access logging.

Modular adoption

Start with the workflow creating the greatest need.
